Houthis Attack Saudi Arabia • Water Plant Migration • Nobel Prize Awards • A New Transformer

"it's been a century"

MISSILES, MEDALS, WATER PLANTS AND TRANSFORMERS?!

Houthi Strikes, Nobel Prizes, Water Treatment Plant Relocated & improved, and a new Electric Transformer?! (not optimus prime)

The Search for the Next SOFWA SMA Leader Is Underway!

Based on an interview with Ust Isro, the selection process for the next SOFWA SMA leader is officially in full swing! The procedure is practically identical to the one used to select the SOFWA SMP leaders. If you're wondering how the new leader is being chosen, here's how the **three stages work**.

1st Stage | Scouting:

- First, a Google Form was sent to all 11th graders, asking them to nominate the person they think should lead SOFWA (and explain why). Students could also nominate themselves if they felt ready. This stage accounts for about 10% of the total score.
- Teachers were also given their own form, which accounts for 15%.
- The remaining points come from administrative criteria, with Adab being the biggest factor at 40%. Other criteria include public speaking, leadership, Qur'an, and English.
- Around 10 candidates passed this stage, and their names were posted on the *mading* (notice board)!

2nd Stage | Interview:

- The 10 candidates are interviewed by Ustadz Isro (SOFWA's supervisor) and Kaisar Assyauqi (the current SOFWA SMA leader).
- Of these 10 candidates, only three to five will move on to the final stage.

3rd Stage | Majelis Syuro':

- The finalists must present their vision and mission to the Majelis Syuro' (Ustadz Johan, Ustadz Giri, Ustadz Zulkarnain, and Ustadz Gufron). They must also explain how they plan to improve their *angkatan*.
- Each ustadz asks around five questions in Indonesian, English, and Arabic, including questions about various hypothetical scenarios.
- Ustadz Isro is not part of the interview panel at this stage. Instead, he acts as an intermediary and distributes the scoring materials.

Current Progress & Extra Info:

Interview progress: As of September 29, seven of the 10 candidates had completed their Stage 2 interviews.

The remaining three: One candidate was absent due to illness, while the other two had just returned from Malaysia after competing in WICE. Rumor has it that they may also be sick.

Editor spotlight: Our very own editor, Khalifah Agidra Filard, somehow made it into the **top 10 candidates** for Stage 2. 👀 *(He did not edit this article to avoid bias.)*

What happens after the Ketua is chosen?

- The finalists who are not selected as Ketua can join the BPH (Badan Pengurus Harian) as vice leader, secretary, or in other core roles.
- The new Ketua and BPH will then select the remaining SOFWA members. Ustadz Isro will not force them to choose specific people; he will simply guide them.
- **Important rule:** Students cannot join SOFWA if they have an active SP (Surat Peringatan), which remains valid for six months.
- Once the full team has been formed, they will attend LDKS and begin planning their programs!

Writer: Muhammad Baary Salman

INTERNAL FIWA NEWS! PT.1

— Building H update sneak peek 👀 version 2.0.26

Building H Is Officially... Not Finished.

However, construction is underway, and the building appears to be about halfway finished! *(At least, I think so... I'm not entirely sure.)* Building H used to be a flat, dirt-covered plot of land next to the football field. Construction began last year, and, in my opinion, the building is looking great. Here's an overview of its planned layout.

- **First floor:** This floor will house a new mosque, a very spacious mosque infact, (4x the size of our current mosque!) which will occupy roughly two-thirds of the floor at the back. At the front, a new FIWA library will take up the remaining third.
- **Second floor, first half:** Its purpose has not yet been confirmed. Some sources say it may contain rooms for "special" guests, but that has not been verified.
- **Second floor, other half:** This area will be an outdoor space used for market days. On regular days, it may be used for something else. 👀
- **Third floor:** This will be a multifunctional hall (*aula*).

The third floor will also include two smaller, intermediate levels known as **mezzanine floors**. The multifunctional hall could be used as a basketball court. Current renderings show seating and stands along the sides.

Rather than looking only at the future plans, let's take a look at the **current progress:**
(its at the other half of the page, woops)

Vision on what building H will look like:

3D Render of the Vision on what Building H will look like (photo angle taken from the area between badminton field and the basketball field)

3D Render of the Vision on what Building H will look like (photo angle taken from the restaurant's entrance)

- The framework for the first floor is finnaly complete, while the framework for the **second floor** is almost complete as well.
- The areas that look like the "third and fourth floors" from the outside, including the window designs, will actually be the mezzanine floors.
- Construction of the multifunctional hall is somehow already underway.
- According to Ustadz Luthfi, the building is expected to be completed next year, although the exact month has not yet been announced.

What building H currently looks like:

INTERNAL FIWA NEWS! PT.2

— Contrary to public opinion, we are not talking about living water plants

Water Treatment Plant Moved & Improved!

— Water Treatment Plant (WTP) relocated to next to Gedung B, Water Capacity Increased, and all school water-related problems fixed since the 28th of September

The Water Treatment Plant (WTP) has been relocated next to Building B, increasing water capacity. Most school water-related problems have reportedly been resolved since September 28.

Ever since the student break began, members of the FIWA community have reported several water-related problems, including a strong chlorine-like smell and taste, water shortages during students' shower times, and dirty water.

The cause was the **relocation of the Water Treatment Plant (WTP)** from beneath Building C (known as the "C Basement") to a location next to Building B. But why did this cause problems?

During the relocation, some facilities had to be taken offline. After all, you cannot exactly use a water filter while it is being transported on a truck! According to Ustadz Fiyan, the school was supposed to use bottled water, such as Aqua, or other water sources during this period. However, FIWA uses around **115,000 liters of water per day**, so those alternatives may not have been enough to meet demand.

The relocation was scheduled during the student break to prevent students from being left without water. However, the work took longer than the three days allocated for it. Moving the equipment and rerouting the pipes took time, which meant that students experienced water-related problems.

Even after the relocation was completed, some issues remained. For context, FIWA draws its water from the Cisadane River. As the region transitions into the rainy season (see the weather article), rainfall becomes heavier. Rain falling directly on FIWA does not necessarily affect the water supply, but heavy rain upstream can affect the Cisadane River. When it rains upstream, mud, dirt, stones, and other debris can enter the water system and potentially clog the pipes. Sometimes, maintenance workers have to repair the pipes late at night to restore the water supply.

According to Ustadz Fiyan, most of these issues—especially water shortages—had been resolved by September 28. One solution was to add more water tanks to the Akhwat's water storage facility, which supplies water to our area first.

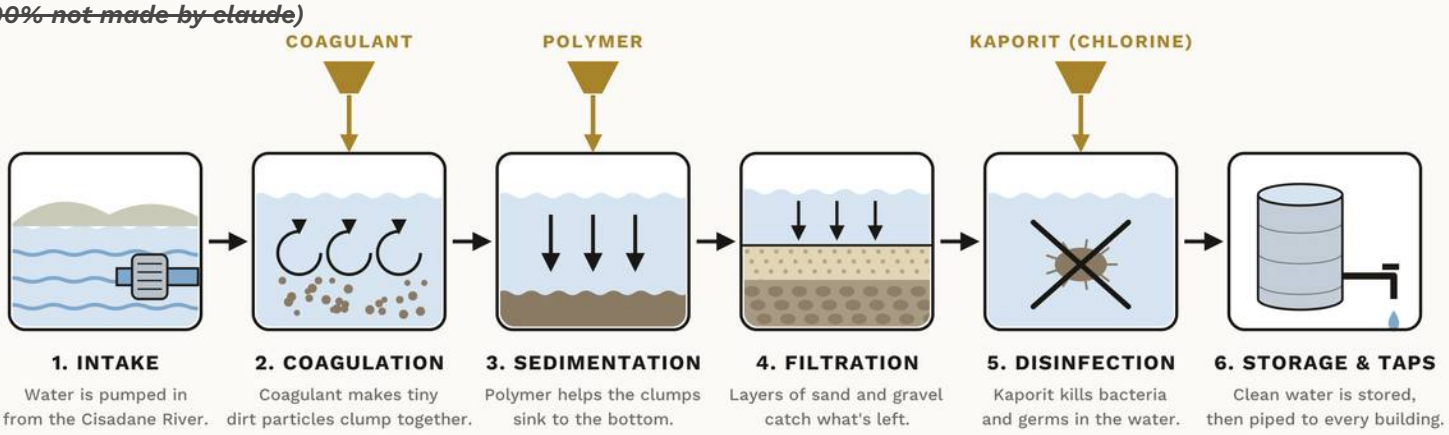

Some students may still notice a slightly chlorine-like smell in the water. Such issues should be reported to the WTP team as soon as possible so they can be addressed. Ustadz Fiyan explained that new water tanks were added on September 28 to help meet the daily demand of 115,000 liters, and that most of the problems had been resolved. Alhamdulillah!

INTERNAL FIWA NEWS! PT.3

— Autobots, uhh, ~~arrive~~ deploy out?

A New Transformer Has Arrived!

— A new transformer has Arrived, but will it be able to fix the problems?

Between September 18 and 20, during the student break, a brand-new transformer was installed outside the main gates of FIWA Ikhwan. According to Ustadz Fiyan in an interview, its purpose was to separate the electricity usage of the Ikhwan and Akhwat sectors. This is expected to make electricity use easier to manage and reduce afternoon power outages.

The main cause of the blackouts is the power limit. According to Ustadz Fiyan, head of the Maintenance Division, PLN classifies FIWA as a low-usage customer. The school can draw a maximum of 200 amperes; if usage exceeds that limit, the power cuts out immediately.

The biggest electricity consumers at FIWA are the air conditioners (ACs), followed by the water treatment plant. FIWA has carefully designed an AC schedule to keep electricity usage below the 200-ampere limit. However, students have frequently turned on the ACs outside the scheduled times, causing an overload and a subsequent power cut. This happens most often in the afternoon, which is also when we experience the most blackouts.

FIWA's schedule is specifically designed to address this problem. One measure is to arrange the AC schedules for the Akhwat and Ikhwan sectors so that they do not overlap.

In a separate incident, at around 3:20 p.m. on September 23, after the eighth period, smoke and sparks were seen coming from A2's blue power box.

Due to an unfortunate series of events (pun intended) involving incorrectly positioned circuitry, a battery that was already fully charged continued charging when it should have stopped. This caused the battery to swell and overheat. The potential fire was extinguished before it could escalate.

Given these incidents, we urge all students to **please stop turning on the ACs outside the scheduled times**. If you do, the consequences affect the entire school. Are we tired of complaining about blackouts? Then this is one way to help prevent them. Sometimes, we have to sacrifice our personal comfort and convenience for the greater good of those around us.

*Image of the brand new installed Transformer on the right, alongside the old one on the left.

FIWA QUIZ:

What is the canteen food breakfast for Wednesday

1. **Indomie Rendang**
2. **Omu Rice**
3. **Nasi Putih & Bihun**
4. **A5 Wagyu Steak & Garlic Mashed Potatoes**

The Answer will be posted next edition!

Previous quiz answer: 3. Ustadz Fiyan

Quiz Creator: Ammar Mufiid Johansyah

INTERNAL FIWA NEWS! PT.4

— Weather transitioning to the Rainy Season, and more!

What a VERY thundery afternoon. huh?

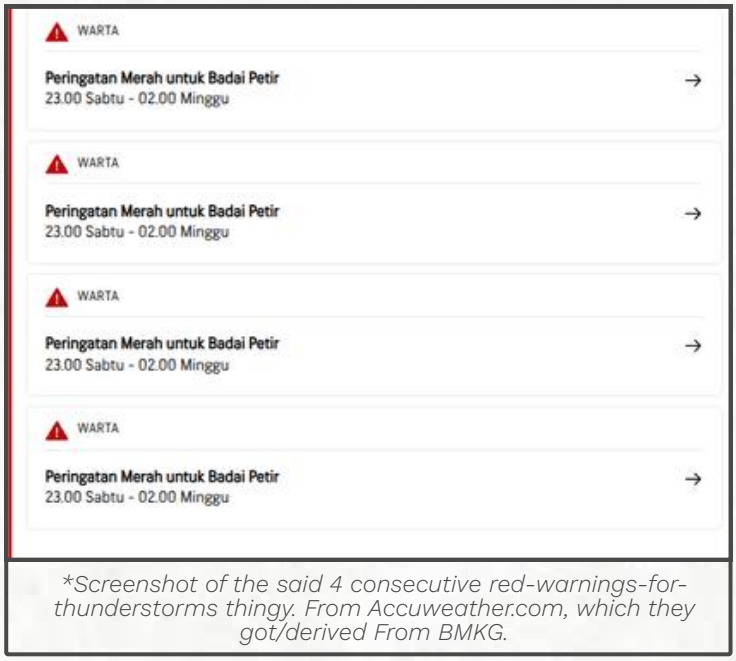

— A big thunderstorm on the 26th of September, and weather updates

On 26 September 2026, a severe thunderstorm struck at around 4:45 p.m., while students were exercising and playing in the fields and swimming pool. Signs of a major storm had already appeared, including dark clouds and strong winds. The winds were so powerful that possibly hundreds or even thousands of seeds from the trees between the swimming pool and the football field were blown off and rained down.

What followed was an extremely heavy thunderstorm, with lightning reportedly striking the ground every 15 seconds, according to some students. Furthermore, *BMKG* (*Badan Meteorologi, Klimatologi, dan Geofisika*) had issued four consecutive red warnings for thunderstorms, forecasting that the storms would occur between 11:00 p.m. on Saturday and 3:00 a.m. on Sunday. Unfortunately, it seems that the storm arrived much earlier than expected in Karihkil, striking at 4:45 p.m. instead of around 11:00 p.m.

The following day, Sunday, there was a light drizzle after Asr. The sun was still shining through the clouds, creating what many students would call *"the perfect rain"*—light and gentle, with the sunshine still peeking through the clouds.

Looking at the bigger picture, although our area is technically still in the dry season, late September and early October mark a transitional period between the dry and rainy seasons. This transition is generally expected to settle in fully by late October or early November. That is why we have been experiencing frequent afternoon showers lately: we are in the transitional period, when this kind of weather is common.

*Screenshot of the said 4 consecutive red-warnings-for-thunderstorms thingy. From Accuweather.com, which they got/derived From BMKG.

As of the week of 7 October, rainfall has been becoming increasingly frequent, following the typical pattern of the transition from the *dry to the rainy season*. We should all be grateful that we did not experience more severe weather during the dry season, even though *El Niño* was occurring, as explained in the weather article from our previous edition. *Alhamdulillah!*

Writer: Ammar Mufiid Johansyah

Supercamp: When and Where?

After our last SUPERCAMP in January 2026, we are set to have another one on 12 December 2026. *I wonder why our next Supercamp is also in 2026, just like the previous one, though...*

For our next Supercamp, we will travel to the holy city of Makkah to perform Umrah and visit Umm Al-Qura University. However, Ustadz Gufran is somewhat unsure about whether we should visit the university, since it is a women's university.

Our next destination will be Madinah. There, we will take part in the UIM program and visit Kulliyat at-Taybah and Kulliyat al-Haram. As for Ha'il, we will most likely visit University Of Ha'il. After that, we will head to Jeddah, where we plan to visit King Abdulaziz University. We may also visit the University of Ta'if, although we have not yet confirmed which university we will be visiting for that part of the trip. Honestly, we're not entirely sure yet!

*Photograph taken during our last Supercamp in January 2026

INTERNAL FIWA NEWS! *PT.5*

— Lots of New Rooms & a Lab has been Opened!

Ooooh.. new rooms in B1?

Around early September or maybe around mid-late august, our lovely laundry room in B1 was moved to somewhere around FIWA, most likely in panorama bali. the used-to-be the laundry rooms in B1 were converted to standard dorm rooms for G12. In the grand scheme of things, it didn't really affect its quality & production speed, however, the rooms in B1 has a huge difference comparing to the other dorm rooms inside FIWA (B2, D1, D2) **which is :**

- **No bunk beds!** Yes, you read that right, G12 didn't have to climb ladders just to get on their beds since all the beds are on the same height level.
- **There's some awesome learning desks,** (with ~~functioning~~ chargers ofc) and also comes with chairs so they can study comfortably.
- **Some mini storage drawers under the beds!** and a mini locker right behind the beds.
- **Another desk** (a mini one) right under the mini lockers (the one behind the beds)

All of these information are basically what standard G12 dorm rooms look like but I'm just gonna add it anyway to make this article longer..

*Photograph of the new rooms in B1

Well in my opinion, its really great for G12s and also FIWA can now fit a *little* more students. :)

Writer: Fathan Rasyid Athaya

Robotics Lab Opened?

The Robotics Lab is finally open after 2 months of waiting, our suffering has ended! We can now 3D print, attend the Robotics extracurricular if you are attending the lesson, and the best part if you attend the Robotics extracurricular, there's two sessions!! The first one is at 13:30 till 14:30, and the second one is at 16:00 till 17:00.

They also prepared **Laptops** for us to code, ALSO there's a new functional table. It's got wheels and if we combine two tables together, we can do ***long distance robot testing*** and also we got chargers? Do I hear it right? Yes I am, THERE ARE CHARGERS ON THE TABLES. It's functioning right? ig idk. There's a new and better 3d printer aswell, the "Bambu Lab A1" specifically. Also it prints sooo much better according to **the Ustadz**.

There's also a new set of "*Raspberry Pi*" mini computers, and it's already being **supported by AI**, mainly for more advanced robotic lessons. There's also new laptops, and fun fact, the laptops we used before is 5 human years old (That's old), and we got some new **specs**, with some of them including having

*Photograph of the Robotics Lab

16 GBs of **RAM** *(Random-Access Memory)* instead of 4 GB, and better **memory**, hopping from 256 GB to 512 GB. Last but not least, the **CPU**s are also amazingly better, upgraded from the "Intel Core i3" to "Intel Core ULTRA 5" (it even sounds cool by the name) (I agree).

STUDENT ACHIEVEMENTS

— FIWA Students head to Malasyia for WICE (World Invention Competition and Exhibition), as well as an MUN Competition; AYIMUN!

Being a Diplomat for a Weekened

— A FIWA Student takes on the Model United Nations Stage!

On the 26th-27th of September, 2026, A Grade 8 Student; Yahya Abdullah Mahmudi, participated in an *MUN* (Model United Nations) competition. specifically, *AYIMUN* (Asian Youth International Model United Nations), at it's Cibubur Chapter.

For those who aren't familiar with what MUN is, it's essentially a competition where students act as diplomats, debating world problems the way real UN delegates do. We asked Yahya if we can say it's LARPing as the UN. He said yes. So **MUN = Larping as UN Members in Debates & stuff.**

Alhamdulillah, he got the award of "**Verbal Commendation**", which means he got the 4th place in the competition. The third place is Honorable Mention, the 2nd is Outstanding Delegate, and the 1st is Best Delegate.

During the MUN Cibubur Chapter (chapter meaning National Versions of MUN instead of the normal international MUNs), the main council that they were representing was ECOSOC & ILO. Yahya specifically was representing the country of the United Kingdom (countries are random).

Basically, the goal of that competition was to try to agree on a specific solution on 3 problems, in which we don't know. There were many arguments (obviously), one of the delegates representing Libya for some reason brought the unrelated problem of Taxing Billionaires for state money. You can think about this just a little longer and understand the argument being made and how unnecessary it most likely is.

If you are interested in MUN, there are a few more things for you to know. One of them is that you Must have a strong foundation in Diniyah, because there you will be exposed to a very diverse enviroment and lots of ideologies as well, so to protect yourself agains the Syubhats & Shahwats, you gotta have a strong foundation. Other than that though, if you do get an MUN certificate, it's gonna be a big sign that you can lead people when applying for universities and stuff. Overall, it's pretty cool.

Writer: Ammar Mufiid Johansyah

To Malasyia, for WICE!

Around the 20th - 24th of September, 2026 (a few weeks ago), approximately 18 People went to Malaysia to go to a competition, which is **WICE!** (World Invention Competition and Exhibition).

For those who dont know, WICE is an internationally recognised competition organised by IYSA (Indonesia Young Scientist Association) in collaboration with Universities in Malasyia like SEGi University and more, in which you guys make innovations & projects and stuff, and essentially share it to the world!

Alhamdullillah, FIWA won **3 SILVER** medals within WICE 2026. The names of the teams and the awards are on the right as you guys can see.

The benefits of WICE is quite large, as claimed by the winners, since it's an internationally recognised competition, if you won a gold medal or smth, it might be a big win for your portfolio! Yeah that's it ig.

**Image of the Post made by FIWA's Instagram of the WICE 2026 Winners (from fiwa ofc)*

FITRAH TRIBUNE

— What's FITR and what do we do?

**Insignia/Logo of Fitrah Tribune, Cream White representing Approachability, Yellow/gold being Clarity, and dark blue being Trustability.*

Fitrah Tribune (Or FITR for short) is a community made by students. A student community, with the main purpose of creating amazing cool fascinating mind-blowing interactive shocking newspapers, and general Journalism! It's also important to note that Fitrah Tribune is completely separate from every other internal organisation in FIWA except for FIWA as an institution as a whole. So no, we are not part of SOFWA or any other organisations, even though maybe some of our members are in SOFWA as well.

Currently, we post newspapers around every 2-3 weeks (Semi-Fortnightly), after realising that 2 weeks is too harsh on us, and we couldn't handle the pressure :v. We use english as the primary language in them, with this brand new format thats' been clarified in the Last Edition (edition 3.5)! We use minimal/zero AI assistance for creating the newspapers and when we mean minimal/zero we mean not copypasting slop from them and so on.

OUR STANDARDS

1. Clarity

How the information is perceived. Every article is researched and should be easy to take in.

2. Approachability

Not too professional, not too casual. We write the way a thoughtful older sibling would explain; with care, but without stiffness.

3. Trustworthiness

Our standards are the same in every Edition. Trust grows slowly, and we build upon it edition after edition.

4. Transparency

We do not remove facts or alter them in any way. If we've made a mistake, we will announce it as a mistake

TRIBUNEES:

**As Of Edition 5, Of course.*

EXTERNAL NEWS! PT.1

— Houthis' Attacks on Saudi Arabia

Surge on Riyadh: The Houthis Strike Once More

On October 10th 2026, the Zaidi sect-influenced paramilitary group of the Houthis from Yemen launched an attack considered as the deadliest attack on Saudi Arabia in more than a decade. Targeting Riyadh's King Khalid International Airport, the attack cost at least 12 lives and wounded more than 300 innocent people.

300+

people wounded at King Khalid International Airport, 10 October

SOURCE: AL JAZEERA

*Photo of the Attack on Riyadh's King Khalid International Airport, on a Smartphone.

Timeline Of Events:

- **2004** Rebellions against Yemeni Goverment
- **Sept 2014** Takeover of Sana'a, Yemen's Capital by Houthis
- **Mar 2015** Saudi-led "Operation Decisive Storm"
- **Dec 2018** Stockholm Agreement
- **Apr 2022** UN-brokered Truce
- **28 Mar 2026** Houthis Enter Iran War
- **10 Oct 2026** Riyadh Airport Strikes

This attack adds to the series of uprising movements by the Houthis during the 2026 Iran war. The Houthis, long part of Iran's "Axis of Resistance", officially entered the war on the 28th of March 2026, rallying alongside Iran against its opponents: the U.S., Israel, its allies in the West, and Saudi Arabia. However, this is just the tip of the iceberg. Their history of rebellion against the West and the Sunni understanding of the Wahhabi dates way back, decades ago.

Who are the Houthis?

The Houthis aren't just some random rebels trying to mess with the government. All their actions, movements, and beliefs are based on one ideology: **Zaidiyyah**, a branch of the **Shi'a**, which Ahlus Sunnah regard as misguided. The Zaidiyyah take Zayd ibn Ali as their fifth imam, a man who led a famous armed rebellion against the Umayyad dynasty in 740 CE. His rebellion keeps fueling the spirit of rebellion among his followers until now.

Furthermore, the Houthis, just like other branches of the Shi'a, have shown hostility and dispute towards the sunnis, most clearly towards the Salafis of Dammaj in Sa'dah, whom they besieged and forced out in 2014. This is rooted in their belief that the leadership of the Muslim community should be in the hands of Prophet Muhammad (sallallahu 'alaihi wa sallam)'s descendants through 'Ali and Fatimah, from both Hasan's and Husayn's lines. Because of this belief, they hold that 'Ali was more deserving of leadership than Abu Bakar, Umar ibn Khattab, and Utsman ibn Affan, and that rising up against rulers outside this line is a duty, resulting in many rebellions throughout Islamic history.

A Two Decade Bloodbath

This fuel of rebellion and deep hatred towards western cultures and the Saudi-backed Sunni development in Yemen is what drives the Houthis in their 2-decade-long bloodbath, starting from rebellion against the Yemeni government in 2004, the takeover of the Yemeni Capital Sana'a on 2014, and the fight against Saudi's "Operation Decisive Storm", on March of 2015.

Peace treaties and agreements has been made with them throughout the years, such as The Stockholm Agreement (2018), and the UN-brokered truce (2022), but unfortunately, these agreements shattered after a short period of time due to mutual distrust on both sides.

What Should We Do?

To put it simply; **The Most Important Thing We Can Do is Pray.** Pray for our brothers and sisters in Yemen and Saudi who got hit by the attacks, and pray for the Houthi Shi'a to get Hidayah.

We should not call out the countries leaders to criticize them, and we should also **Shield ourselves from Syubhats that can lead us to becoming like them.** Because if your Iman is too weak, then you fall into the misconceptions that have made them. May Allah subhanahu wa ta'ala end this conflict to create a more suitable future for next generations to come.

EXTERNAL NEWS! PT.2

— All Nobel Prizes of 2026!

Prestigious Nobel Prize laureates of 2026!

— Six prizes and ten laureates, announced in Stockholm and Oslo from 5 to 12 October.

PHYSICS - 6TH OF OCTOBER

Francis Halzen

"For decisive contributions to the IceCube Neutrino Observatory and the discovery of high-energy neutrinos of astrophysical origin."

Halzen is a Belgian-American physicist and professor at the University of Wisconsin–Madison. Halzen's discovery was indeed highly impactful, such as allowing scientists to capture ghostly, near-massless subatomic particles that travel straight from the edge of the universe without scattering or changing direction. One more massive impact is enabling researchers to trace high-energy neutrinos back to violent extragalactic phenomena; such as blazars, supermassive blackholes, and exploding stars. Allowing humans to study processes that traditional light-based telescopes are impossible to capture.

CHEMISTRY - 7TH OF OCTOBER

Henri B. Kagan & Kenso Soai

"For the discovery of non-linear effects and autocatalysis in asymmetric organic synthesis."

Kagan is a French chemist at Université Paris-Sud, and Soai a Japanese chemist at the Tokyo University of Science. The two men solved a century-old mystery regarding homochirality; how living organisms came to exclusively use only one version of mirror image molecules rather than equal mix. Kagan developed new ways to manipulate chemical reactions to create a strong excess of one mirror-image form over another through asymmetric catalysis. Kenso Soai discovered asymmetric Autocatalysis (known as Soai reaction). Their work has a massive impact on designing pharmaceuticals, fragrances, agrochemicals, and understanding the chemical origin of life that's been a mystery whose answers vary from various people around the world.

PHYSIOLOGY OR MEDICINE - 5TH OF OCTOBER

Karl Deisseroth, Peter Hegemann & Georg Nagel

"For their discoveries concerning light-gated ion channels and Optogenetics."

Deisseroth is an American psychiatrist and bioengineer at Stanford University, Hegemann a German biophysicist and professor of neuroscience at Humboldt University of Berlin, and Nagel a German biophysicist at the University of Würzburg.

Optogenetics is a revolutionary technique that allows scientists to control specific nerve cells using light, helping researchers study brain circuits and conditions like Parkinson's disease, depression, and Alzheimer's disease. Three of the laureates each receive an equal one-third share of the twelve million Swedish Kronor prize.

ECONOMIC SCIENCES - 12TH OF OCTOBER

Robert E. Hall & Michael Woodford

"For microeconomic foundations of macroeconomic stabilisation"

Hall is a professor at Stanford University, and Woodford at Columbia University. Instead of relying purely on historical statistical correlations between broad variables, Hall and Woodford built macroeconomic models directly on microeconomic foundations. They demonstrated that when central banks and governments clearly communicate their future policy intentions, they can actively shape public expectations and steer the economy. Central banks and finance ministries worldwide use these models to design better-timer monetary and fiscal policies. The models have proved vital in helping the global economy navigate major modern disruptions, including financial crises, the COVID-19 pandemic fallout, and subsequent energy shocks.

EXTERNAL NEWS! PT.3

— Nobel Prize Part 2, and a Major Weather event!

Nobel Prize Laureates of 2026 *Continued from page 10*

PEACE - 9TH OF OCTOBER

Navi Pillay

"For her efforts to promote peace and international law."

The Nobel peace prize this year was awarded to a former United Nations Human Rights chief and International Criminal Court, Navi Pillay, who is also a jurist and a lawyer from South Africa. Pillay honored her lifetime of work in global justice and human rights. At wit, Pillay, as a judge and president of the International Criminal Tribunal For Rwanda, heleped to establish frameworks against genocide and humanity issues in Rwanda. Also her contribution to promote international peace solutions to the Israeli-Palestine conflict, from 2021 unto 2025, Pillay chaired a UN commision that investigated violations in Israel, saying that Israel committed genocidal acts in Gaza. Assuredly, Israeli prime minister Benjamin Netanyahu and President of the US Donald Trump strongly condemned Pillay's statement. Pillay was accused of bias and blood false claims against Israel. While Israel's foreign Ministry called the award a weaponisation of the prize.

LITERATURE - 8TH OF OCTOBER

Anne Carson

"for her bold and inventive oeuvre that, in playful dialogue with the classical tradition, has created new forms for contemporary literature"

Carson, a Canadian poet, essayist, and classicist, is known for blending poetry, essays, and fiction. "She is widely considered one of the most innovative and fearless writers in contemporary literature, celebrated for dissolving the boundaries between poetry, scholarly essay, and fiction. Carson has published more than 20 books. Her most impactful publish, amongst them is the "Autobiography of Red", Carson's breakout masterpiece. A novel written in verses that reimagines an ancient Greek myth about a red-winged monster. She wrote the book as a uniquely heartbreaking novel. The book was written in 1998. She has accumulated almost every major literary honor in the world, with its peak receiving the 2026 noble prize literature. Her unique writing style, rather than just treating poetry as a rigid form, she treats poem like a physical object or a drawing. Carson focuses heavily on the theme of loss, grief, and the bittersweetness nature of desire.

Earth on Its Highest Boiling Point: The Super El Niño

— This year's El Niño is on track to be the strongest since records began in 1950, and its effects are already reaching Indonesia.

347 million

children in nearly 100 countries face higher risks of extreme droughts and flash floods

SOURCE: UNICEF

The Godzilla El Niño is currently on track to be the strongest El Niño of all time. The Japan Meteorology Agency (JMA) and the National Oceanic and Atmospheric Administration (NOAA) expect this year's El Niño to be the strongest since recording started in 1950.

In October 2026, the temperature of sea surface in the Pacific territory (Niño 3.4) surpassed 30.06°C, the first time in history to exceed the limit line of 30 degree celsius. The phenomenon is predicted to reach its peak in December 2026 with an anomalous temperature reaching up to +3.7°C above normal.

The United Nations Children's Fund (UNICEF) warns that this 'Super El Niño' threatens **347 million** children in the whole globe for the risk of extreme multiple-at-once weather: extreme drought in several places and severe flash flood in several places.

FLOODS ACROSS THE WORLD:

Recently a massive tragedy at the Nepal-Tibet border caused by an ice chunk rockfall to the Lhende Khola river. This tragedy triggered a flash flood that claimed hundreds of souls and thousands of others were reported missing (Euronews).

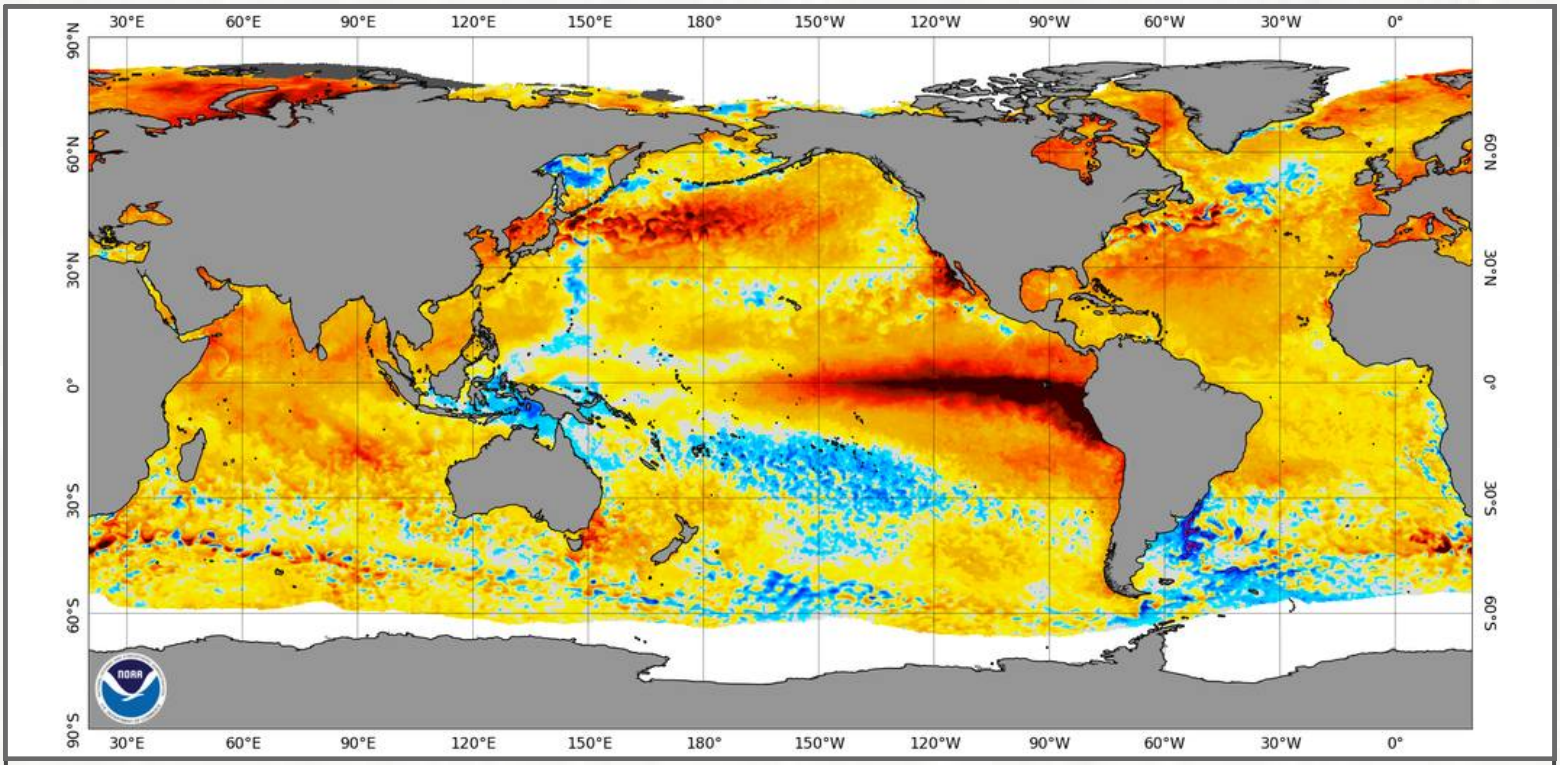

The United States of America is also imperiled and not free from the threat of the "Godzilla" flood.

The Super El Niño Continued from page 11

Sea-surface temperature anomalies across the entire globe, 11th of October, 2026. The redder the colour, the warmer, and the bluer it is, the colder. The warm band along the equator is El Niño. Source: NOAA.

The US Has Started to brace for the upcoming most catastrophic winter. In California, the coastal flood warning that is usually never warned in September, now had been warned two times due to high waves that was caused by El Niño (theguardian.com).

CLOSER TO HOME

Forest fire and fires in the national park of Sembilang (Sumatera Selatan) have burnt more than 8.000 hectares of forest and the fire has started to get out of control even reaching the province of Jambi. Firefighters are having a hard time demolishing the fire through land because of the extreme atmosphere. And the weather modification technology becomes the only hope.

Latest research from the University of Gadjah Mada shows that the extreme heat temperature in Indonesia has become not just a climate issue but a pressure to local economy where UMKM earnings has shown a decline up to 14% due to reduced productivity in agro or under the sun.

> *"Without Adaptation, droughts become hunger crises; storms become debt crises; and heatwaves become killers"*
> — ANTÓNIO GUTERRES, UN SECRETARY-GENERAL

THE DEBATES

In the sector of politics and science, world's climate high ranking officials are having a deadlock. Members of the Intergovernmental Panel on Climate Change (IPCC) have not been on a consensus regarding the release date of the latest science report on climate change.

Latest report from UNEP states that the exceeding of the limit of global warming 1.5°C now is almost unavoidable. Global narration now has shifted from how to prevent global warming, to how we can shorten the duration of overshoot (temperature overheat) so that the earth could cool and return to it's original temperature.

A portuguese politician and diplomat Antonio Guterees spoke on the 1.5°C limit target failure: "This summer's scorching scorching heat, raging wildfires and deadly floods area warning of what lies ahead. We must make the overshoot above 1.5°C degrees as small and short as possible. That demands an overshoot of ambition."

Guterees also criticise about people's dependence on fossil fuels and gave an image on realistic aftermath of the extreme climate change: "Without adaptation, droughts become hunger crises; storms become debt crises; and heatwaves become killers". He also started a global movement named AI Environmental Transparency Initiative due to AI data centers uses massive energy and an overwhelmingly large amount of water (news.un.org).

— Ammonia Into Hydrogen, and Space-Related stuff

Turning Ammonia Into Hydrogen

SO SCIENTISTS FOUND OUT THAT WE CAN TRANSFORM TOXIC AMMONIA INTO USEFUL HYDROGEN OMG.

The research was funded by the U.S. National Science Foundation. MIT researchers have found a more efficient way to turn ammonia to hydrogen using electricity. Previously, this needed high temperatures and extra purification. The new electrochemical method makes the process simpler and produces high-purity hydrogen with less energy.

This approach uses a palladium-based membrane and molten hydroxide electrolyte (what is that anyway) to separate hydrogen from ammonia. The membrane selectively transports hydrogen, creating a concentrated stream without further purification. It operates at 200 to 300 degrees Celsius, much lower than the previous 500 degrees Celsius requirement, saving energy.

The method was also applied to methylcyclohexane (try to say that!), another hydrogen carrier, showing potential for transportation and semiconductor manufacturing. Despite the high cost of palladium, researchers aim to reduce its use and scale up the process. (I knew it there's always a catch)

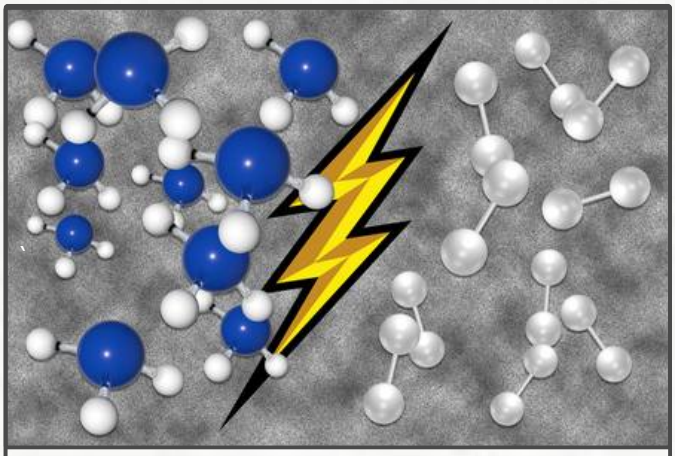

*Image of Ammonia (left) and Hydrogen (right)

This study shows the potential of electrochemical methods to improve hydrogen extraction and storage, advancing the hydrogen economy. This could lead to cleaner energy solutions and better industrial processes.

Meteor showers at the end of October; A Magnificent sight on a Majestic Night.

Earlier this year, we watched Halley's comet's smaller debris during the Eta Aquarid Meteor Shower. Now, another meteor shower from the same comet is about to come: the Orionids. The meteors will pass before subuh. Perfect to sleep early, then sip a coffee while watching the stars. The shower has already started (since the 2nd of October), but the peak of the rain will be before subuh on the 21st–22nd of October.

Fun Facts:

- It can be seen from both the southern hemisphere and the northern hemisphere. So all people around the world could watch it.
- The speed of the meteors is very fast, around 66 km/s, leaving glowing trails and sometimes a fireball. The trails can stay in the sky for a few seconds.
- At the peak, you can see around 15–25 meteors per hour under a dark sky.

A binocular scope won't help, because it only shows a small part of the sky. So, use your eyes and wait for the spectacular meteors to fly across the field of stars.

Also, Google featured a Doodle on the 6th of October about World Space Week. And many of us were confused by that. Well, this event is the largest annual space event, and it celebrates the first time ever humans launched a satellite and explored space, with Sputnik 1 from the USSR (4th of October 1957), and the signing of the Outer Space Treaty (10th of October 1967).

This year's theme was "Rocket Revolution". They've held many engineering workshops, webinars about rocketry science and space physics, and developed access for adolescents to find out more about space.

Triple-Header, All Asia, Extreme climates? Must be an experience.

A triple-header on started on Baku with the hardest braking spot 90 degree turn to the left. Everything went smooth at Turn 1, yet. Lap by lap, crash by crash. Especially on lap 36 after VSC restart (Albon's crash). Colapinto did a lock-up, drifting into 3 cars. And making them DNF.

In the final stint Verstappen is chasing Russell with his **5 Major Upgrades** with his car for 12 laps. Lap 51, Bottas run wide, at the end of sector 2. Triggering a yellow flag Russell lIft- and coast too long, decreasing the gap between Max. And Sector 3 is the real battle of wins. Russell still defend perfecty and won with the closest gap *over 24 years*. Also the most DNF on season 2026. Both of them are happy for the fight and happily live, till next race.

*Photograph of Russell's sudden DNF on Lap 55 at Sepang

The last race of triple-header ended on Singapore, inviting so many "duality" happening. Max (how many times I've typed him) starting from the first, tailed by the Ferraris.

On Lap 1, Leclerc could almost gain advantage by using inside line, but Max squeezed him up until Leclerc was enforced to brake early, letting max to pass by. You see Max dominate? No, he could barely do coms with his race engineer. Then the Ferrari kept the place until Lewis did a lock-up, making Antonelli climb up to 2 places. And finally, after 10 years driving on the aspal of Marina Bay, Max Verstappen finally won it after 10 years.

This GP make it more special with Nico's point finish and Hadjar gain positions for 12 times till P10

*Photograph of last lap with gap of 0.196 s

The International war cancelled a frustating Bahrain and Saudi Arabia GP. But it brings one of the race into one of the most forgotten circuits. Yes, Sepang.

The climate is how a driver's nightmare must be. High temperature and humid plus aggressive tyre degradation.

The raced on Malaysia was delayed due to heavy rainstorms for 1 hour and 40 minutes.

The Ferrari's immediately fall into the backmarker's place with the soft, while Lawson is chasing Max for P3.

Let's just jump into the "Final 5 Laps". Max is back at P1, Kimi Antonelli on his rear (back). Russell sudden DNF causes Safety Car to occur, making the pack of cars less than a second on Lap 54. Piastri and Lawson fighting for P7. Max finally won his first GP, and the Ferraris? Trace them up.

Surge on Riyadh! The Houthis Strike Once More!!

On October 10th 2026, just about a week prior to the making of this article, the Zaidi sect-influenced paramilitary group of the Houthis from Yemen launched an attack considered as the deadliest attack on Saudi Arabia in more than a decade. Targeting Riyadh's King Khalid International Airport, the attack cost at least 12 lives and wounded more than 300 innocent people.

This attack adds to the series of uprising movements by the Houthis during the 2026 Iran war. The Houthis, long part of Iran's "Axis of Resistance", officially entered the war on the 28th of March 2026, rallying alongside Iran against its opponents: the U.S., Israel, its allies in the West, and Saudi Arabia. However, this is just the tip of the iceberg. Their history of rebellion against the West and the Sunni understanding of the Wahhabi dates way back, decades ago.

The Houthis aren't just some random rebels trying to mess with the government. All their actions, movements, and beliefs are based on one ideology: Zaidiyyah. Being a branch of the Shi'a, which Ahlus Sunnah regard as misguided, Zaidiyyah differs from the Twelver Shi'a (who follow twelve imams). The Zaidiyyah take Zayd ibn Ali as their fifth imam, a man who led a famous armed rebellion against the Umayyad dynasty in 740 CE, and they reject the Twelvers' belief in a hidden imam. His rebellion keeps fueling the spirit of rebellion among his followers until now.

Furthermore, the Houthis, just like other branches of the Shi'a, have shown hostility and dispute towards the Sunnis, most clearly towards the Salafis of Dammaj in Sa'dah, whom they besieged and forced out in 2014. This is rooted in their belief that the leadership of the Muslim community should be in the hands of Prophet Muhammad (sallallahu 'alaihi wa sallam)'s descendants through 'Ali and Fatimah, from both Hasan's and Husayn's lines. Because of this belief, they hold that 'Ali was more deserving of leadership than Abu Bakar, Umar ibn Khattab, and Utsman ibn Affan, and that rising up against rulers outside this line is a duty, resulting in many rebellions throughout Islamic history.

This fuel of rebellion and deep hatred towards western cultures and the Saudi-backed Sunni development in Yemen, portrayed by the Zaidi sect, is what drives the Houthis in their 2-decade-long bloodbath. Starting from the rebellion against the Yemeni government from 2004, the takeover of Yemen's capital, Sana'a, in 2014, and the fight against Saudi's "Operation Decisive Storm" in 2015. And now joining Iran as its loyal ally.

Peace treaties and agreements, both on local and international scales, have been made with them throughout the years, such as The Peace and National Partnership Agreement (September 2014), The Stockholm Agreement (December 2018), and The UN-brokered truce (April 2022). Unfortunately, these agreements, along with many others, shattered after a short period of time due to geopolitical conflict and mutual distrust on both sides, resuming the neverending conflict until now.

The aftermath of this event shows no signs of stopping. The airport was struck again in the following days, killing more civilians. This surge continues with bombardment on the country's energy hubs, as they struck the Saudi Aramco headquarters in Dhahran and claimed an attack on the Rabigh oil refinery.

So.. What should do then?
